

Abstract of the Disclosure

A container has a body and a lid. The body has a peripheral wall having a circumferential edge portion that turns outwardly along its entire length to have a first cross-section. The lid has a circumferential edge portion that turns downwardly along its entire length to have a second cross-section complementary in shape to and for enclosing the first cross-section for surface sealing engagement therewith. The lid edge portion includes four side flaps which are foldable inwardly and upwardly to provide respective resiliently self-expanding hooks for bearing resiliently at an acute angle against an outer surface of the body wall to thereby maintain the sealing engagement, with the lid edge portion forming a gap with the body surface across which the hooks extend.
